Magnets and Their Invisible Force

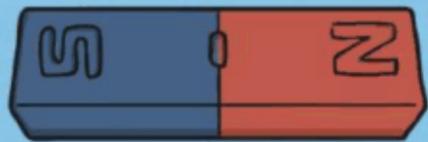

Look at this bar magnet.

It has two different sections, which are often coloured red and blue.
But what are these sections?

Magnets and Their Invisible Force

While you are watching, can you listen for the answers to these questions?

- Which three metals are attracted to magnets?
- What happens when two magnets repel each other?
- What are the different parts of a magnet called?
- Which way will a compass always point?

Magnets and Their Invisible Force

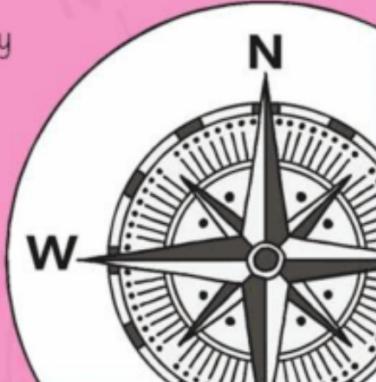

What did you find out?

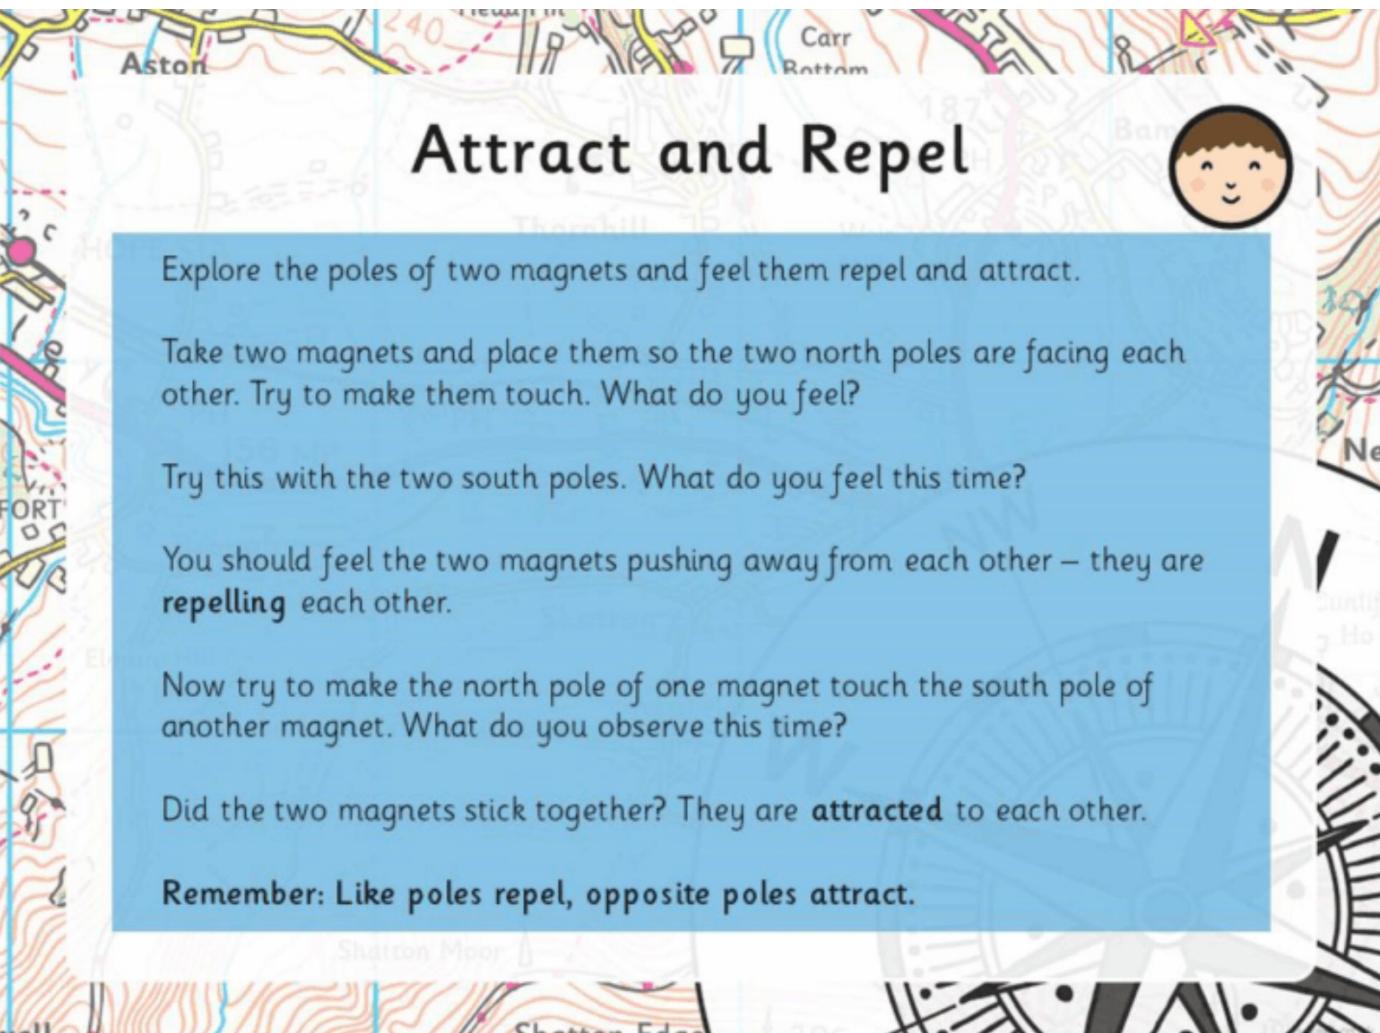

The three metals that are attracted to magnets are iron, cobalt and nickel.

When two magnets repel each other, they push away from each other.

The different parts of a magnet are called the poles. There is a north pole and a south pole.

A compass always points north-south.

Attract and Repel

Explore the poles of two magnets and feel them repel and attract.

Take two magnets and place them so the two north poles are facing each other. Try to make them touch. What do you feel?

Try this with the two south poles. What do you feel this time?

You should feel the two magnets pushing away from each other – they are **repelling** each other.

Now try to make the north pole of one magnet touch the south pole of another magnet. What do you observe this time?

Did the two magnets stick together? They are **attracted** to each other.

Remember: Like poles repel, opposite poles attract.
